

Research task for Active Directory Domain Services:

- Domain Controller (DC)- A server which has ADDS server role deployed and is responsible for managing Authentication and Authorisation of Objects and Subjects within a single domain.
- Domains: A domain is a logical container of a network segment, hosted by at least one server designated as a domain controller. Used to manage Objects and Subjects.
- Trees: A Tree is a collection of domain and subdomains within a single network domain network namespace.
- Forests: A forest consists of one or more separate domain trees, which have the same two-way trust relationships between them as two domains in the same forest.
- Sites: Its physical segment of a Domain network that is separated Geologically from one another.
- 2-way, automatic, transitive trusts relationship
- Organizational Unit (OU): Are container objects within a domain, used to divide the security and administrative responsibility among several divisions or departments.
- Leaf Objects: User, Computers, Printers.
- AD root namespace (in DNS)
mail01.warrington.amazon.co.uk - IP address
websvr1.bolton.amazon.co.uk - IP address
websvr2.london.amazon.co.uk - IP address
- Active directory Database file name? NTDS and Sysvol
- Group Types: Security- ACL and Distribution- Mailing Group
- Group Scope: Group can be assigned permissions in...
Universal: Any domain or forest
Global: Member permissions can be assigned in any domain
Domain local: Member permissions can be assigned only within the same domain as the parent domain local group.
Group Scope in Active Directory: <https://www.manageengine.com/products/active-directory-audit/kb/what-is/active-directory-group.html>
